

Introduction

In today's digital era, online recruitment platforms have become an essential bridge connecting job seekers and employers. Developing a Job Portal as our team project is both meaningful and practical. The project allows us to apply a wide range of technologies, including database design, backend logic, and frontend user interface development, while gaining hands-on experience with full-stack web development. Moreover, the difficulty level of the Job Portal project is well-suited to our team's capabilities.

Target Users and Environments

- **Users:** Job seekers, employers/recruiters, company.
- **Environments:** Web application, accessible on desktop and mobile browsers (Windows, macOS, Linux, Android, iOS).

Key Features

- **Common feature:** Login, logout, register, update account information
- **Applicants:** upload and manage CVs, search/filter/save jobs by location/salary/job position/experiment ..., view job details, apply online, and track application status.
- **Employers:** Manage company profile, post and edit recruitment announcement, view applicants and CVs, label CVs, and respond to candidates.
- **Admins:** Manage job postings, send notifications, and display statistics.
